SPEED AND DISTANCE PRACTICE A ANSWER KEY

Speed and Distance Practice A Answer Key

Understanding how to accurately solve problems related to speed and distance is essential for students preparing for exams, especially in mathematics and physics. Practice questions help reinforce concepts, improve problem-solving skills, and build confidence. In this article, we will provide a comprehensive speed and distance practice A answer key, along with detailed explanations to help you grasp the core principles behind each problem. Whether you're a student studying for a test or a teacher preparing practice materials, this guide will serve as a valuable resource.

Understanding the Basics of Speed and Distance

Before diving into practice problems, it's important to review the fundamental concepts that underpin speed and distance calculations.

Key Formulas

- **Speed = Distance / Time**

- **Distance = Speed × Time**
- **Time = Distance / Speed**

These formulas are the foundation for solving most speed and distance problems. Remember to keep units consistent, e.g., if speed is in km/h, distance in km, and time in hours.

Practice Problem Set and Answer Key

Below are typical practice questions related to speed and distance, followed by their detailed solutions.

Question 1:

A car travels 240 km in 4 hours. What is its average speed?

Answer 1:

To find the average speed, use the formula:

Speed = Distance / Time

Substitute the given values:

Speed = 240 km / 4 hours = 60 km/h

Answer: The car's average speed is 60 km/h.

Question 2:

A cyclist covers a distance of 90 km at a speed of 15 km/h. How long does the journey take?

Answer 2:

Using the formula:

Time = Distance / Speed

Time = 90 km / 15 km/h = 6 hours

Answer: The journey takes 6 hours.

Question 3:

An airplane flies at a speed of 900 km/h for 3 hours. How far does it travel?

Answer 3:

Apply the distance formula:

Distance = Speed × Time

Distance = 900 km/h × 3 hours = 2700 km

Answer: The airplane travels 2700 km.

Question 4:

A runner completes a 10 km race in 50 minutes. What is their average speed in km/h?

Answer 4:

First, convert minutes to hours:

50 minutes = 50 / 60 = 5 / 6 hours ? 0.833 hours

Now, use the speed formula:

Speed = Distance / Time

Speed = 10 km / (5/6 hours) = 10 km × (6/5) = 12 km/h

Answer: The runner's average speed is 12 km/h.

Question 5:

Two cars start from the same point and travel in the same direction. Car A travels at 80 km/h, and Car B at 100 km/h. How long will it take for Car B to catch up with Car A if Car A has a 20 km head start?

Answer 5:

This is a problem of relative speed.

- Relative speed of Car B with respect to Car A = 100 km/h - 80 km/h = 20 km/h
- Distance to cover = 20 km (head start)

Time taken to catch up:

Time = Distance / Relative speed = 20 km / 20 km/h = 1 hour

Answer: It will take 1 hour for Car B to catch Car A.

Tips for Solving Speed and Distance Problems

Understanding common pitfalls and strategies can help improve accuracy.

1. Keep Units Consistent

Always ensure that the units for distance, speed, and time are compatible. Convert units where necessary before calculations.

2. Use Formulas Appropriately

Identify which formula applies to the problem. For example, if you have distance and time, find speed; if you have speed and time, find distance.

3. Break Down Complex Problems

For multi-step problems, write down what is known and what you need to find before setting up equations.

4. Practice Word Problems

Work through various scenarios to develop a flexible understanding of how different variables relate.

Additional Practice Questions for Mastery

To further reinforce your understanding, here are additional questions:

- Calculate the speed of a train that covers 500 km in 5 hours.
- If a boat travels at 30 km/h downstream and takes 2 hours to reach a point 60 km away, what is its upstream speed if it takes 3 hours to return?
- A motorbike accelerates uniformly from 20 km/h to 60 km/h in 5 seconds. What is its

acceleration?

Answers:

- Speed = 500 km / 5 hours = 100 km/h

- Downstream speed = 60 km / 2 hours = 30 km/h

Upstream speed = Distance / Time = 60 km / 3 hours = 20 km/h

- Acceleration = (Final velocity - Initial velocity) / Time

Convert velocities to m/s: 20 km/h = 20 × (1000/3600) ? 5.56 m/s

60 km/h ? 16.67 m/s

Acceleration = (16.67 - 5.56) m/s / 5 s ? 2.22 m/s²
